EMC SEALING SYSTEM

Electromagnetic compatibility

The use of sophisticated equipment onboard vessels has increased and resulted in an extensive need for protection against electromagnetic interference (EMI).

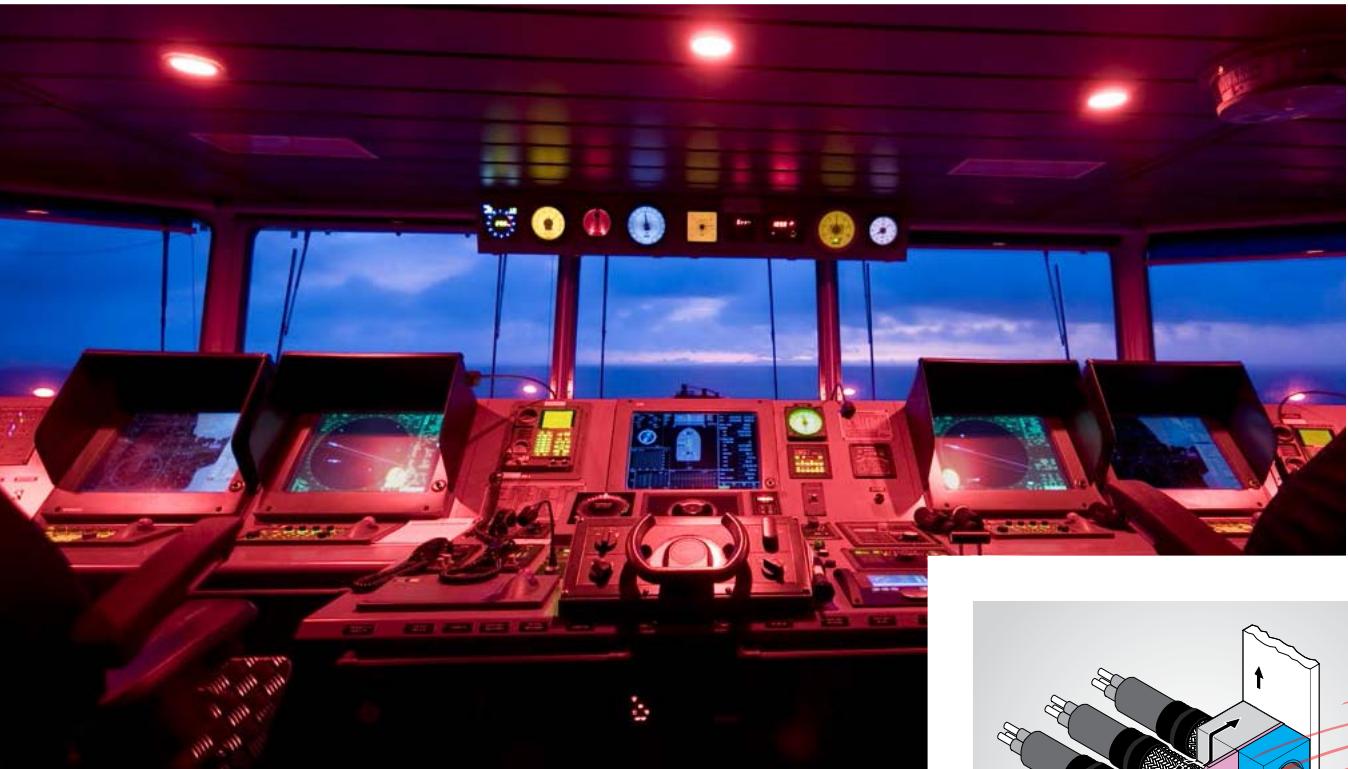

The impact from EMI can be difficult to foresee and can range from harmless symptoms to a severe issue arising from an initial exposure inside a control or safety system. EMI sources capable of causing such issues or levels of disturbance may be unpredictable and also numerous in the many routes they take. Therefore, EMC is a two-way thinking process. You have to make sure your equipment is not directly affected or impaired by various sources of EMI, and also make sure it operates effectively in its intended environment without becoming the disturbing

source of EMI for other technologies or equipment.

Combined protection

The Roxtec EMC product range for EMI protection can combine this with protection against fire, smoke, water, gas, explosion, vibration, dust and dirt. Every cable penetration has its own unique set of risk priorities in respect of its protection requirements. Even when EMC is the core concern, other levels of required protection are not compromised as a result of mitigating the EMI risk.

On a ship, where it is a great concern to ensure personal safety and protect large financial investments, owners can feel safe in the knowledge that the Roxtec EMC product range is performing multiple risk prevention functions at the same time.

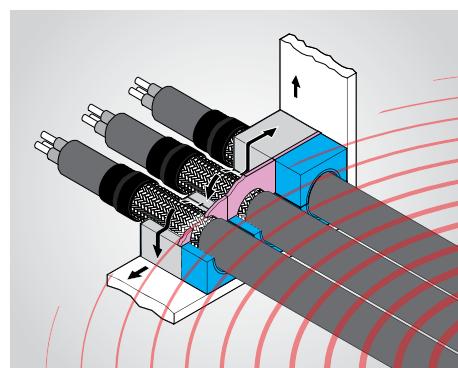

Electromagnetic threats

There are natural phenomena such as lightning strikes, but also predictable causes of interference from radar, wireless communication systems and side effects from switching devices or technical systems such as propulsion systems. Intentional electromagnetic interference and high power microwave (HPM) technology have also become threats that generate a great deal of concern. Electromagnetic disturbances have many different origins, but only two forms of travel. They are either conducted along a metallic object or propagate through air. It is also possible that one single source generates both forms of disturbance.

Increased EMI exposure

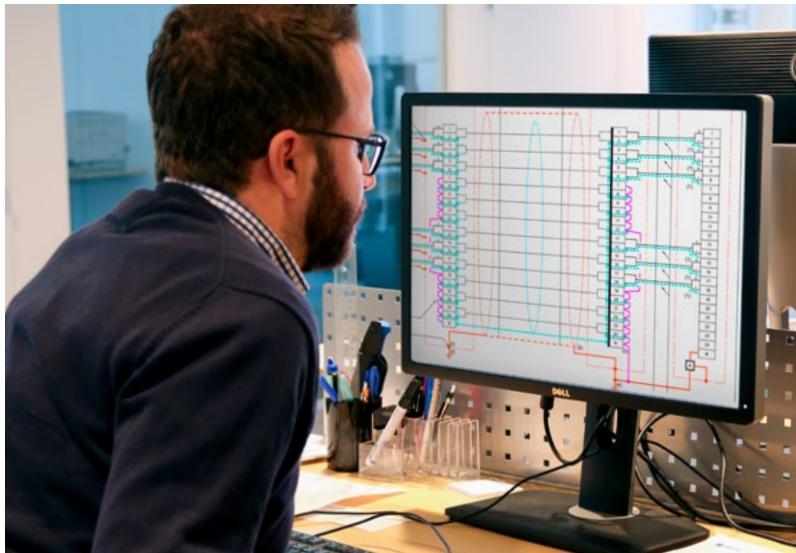

Marine vessels have miles of cables running through their whole structure. With advances in technology generating more and more sophisticated ships, the volumes and variations of different types of cables onboard are also growing.

A material that can conduct electricity can also transport unwanted signals. The armor in an armored cable can pick up and carry signals throughout its whole length and cause interference in a system far away from the original source. This means that normal working environments can generate EMI exposure and this risk is important for designers, engineers and owners to consider.

Required features

In order to eliminate such risks and achieve electromagnetic compatibility, ground connections must be as short as possible and have large contact areas exposed to its mating surface. With flat and wide conductors (tin-plated copper tape or braid) and barriers embedded inside the sealing module, the Roxtec EMC solutions ensure the very best properties over the full frequency spectra.

Plan for EMC to reduce risk and cost

Bonding and grounding solutions for electrical safety requirements such as protective earthing, equipotential bonding and lightning protection cannot be managed independently without considering EMC aspects. Including EMC into the initial electrical design is a way to avoid impairing or compromising the performance of any EMC solution by having to add it at a later stage. Malfunction of systems due to EMI can cause severe operational difficulties and trying to identify EMC problems and track the cause after the event is a difficult process. Predefining electromagnetic zones is a help to decide for a specific penetration where earthing is sufficient or where full electromagnetic shielding is required. A stage by stage approach to identify EMI requirements will enable a cumulative view in identifying the applicable solutions required along the route of the cable.

Only as strong as the weakest link

Roxtec EMI solutions are capable of managing a tight and compressed fit against both sides of a stripped braided armored cable. If not, one half of the cable security would be compromised. A strong and consistent connection to the cable armor is one of the keys for maximizing the EMI protection. With Multidiameter™, upfront knowledge of the exact dimension of each cable is not that important as the Roxtec BG/EMC products are separately adaptable to obtain the correct fit for both the outer sheet of the cable and the armor/shield. Roxtec products also support best practice EMI protection principles by providing a single entry and by having the earth path integrated within the cable entry. The use of combination frames with several openings simplifies the issue of cable segregation in order to avoid cable to cable interference.

Bonding and grounding for EMC

Cable armor, shields or screens all need to be connected to earth, but traditional earthing methods may be ineffective as earth paths for higher frequencies. Flattened braids are commonly used to resolve this problem by combining large copper masses in a flat form to deliver better high frequency properties than a circular conductor.

Embedded braid

The Roxtec BG B/BG solution addresses this issue by having a braid embedded in the seal. It is fitted at the point of cable entry and surrounded by the solid metal frame. Applying such methods for all earthing needs ensures that total EMC requirements are met.

The robust, but still flexible design of the Roxtec solution

- works very well with rigid and irregular cable armor
- withstands high currents if a fault occurs within the system
- withstands surges from lightning strikes
- is an effective protection against conducted interference.

Electromagnetic shielding

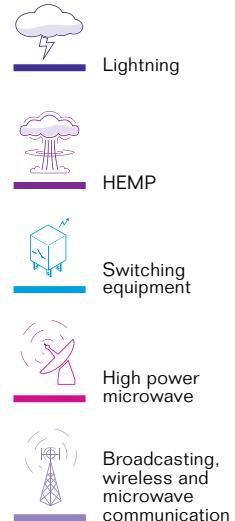

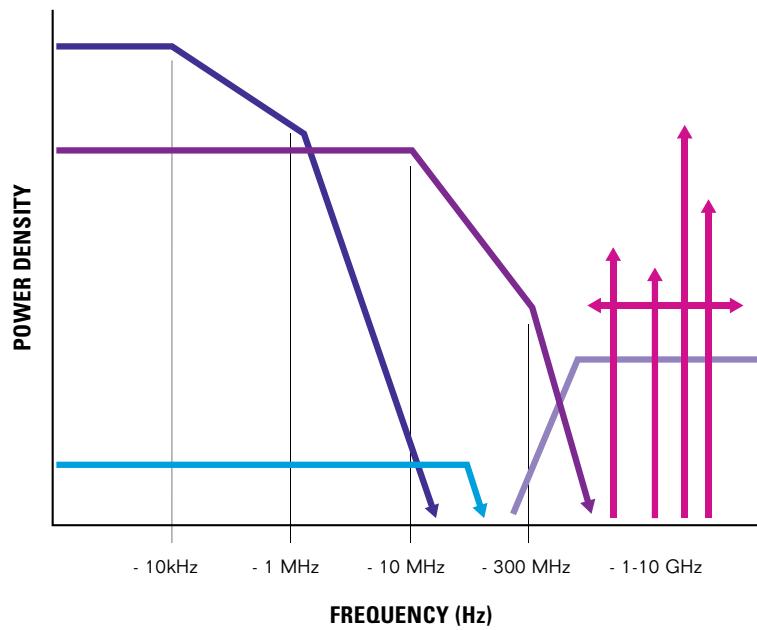

To prevent very high frequencies from disturbing equipment, electromagnetically sealed enclosures and compartments are used.

All cables going in or out from them have to be shielded and connected to earth, and cables with tight shields are required to protect inner conductors from interfering signals. In addition, the gaps between each cable have to

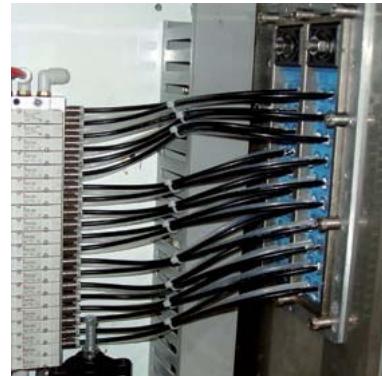

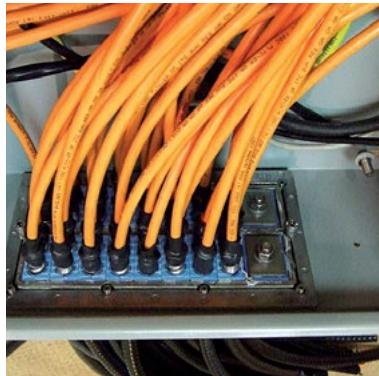

be electromagnetically sealed so the cable entry solution operates as an extension of the conductive wall. This prevents conducted and radiated electromagnetic signals from penetrating the enclosure wall.

The Roxtec ES B/ES solutions achieve this by having a barrier in each module sealing the gaps between the cable shield and the frame, or via the adjacent modules. The seals are tested to a minimum of 18GHz to prove the shielding effectiveness. Transfer impedance from cable shield to frame is also measured up to 30MHz.

Electromagnetic threats

Typical EMC application areas

Terminal and junction boxes

By using the compact versions of Roxtec EMC solutions, you can easily ensure area efficiency and electromagnetic compatibility in connections points all over the ship.

Control cabinets

Roxtec compact EMC seals shield and protect. They also allow the use of pre-terminated cables and provide built-in spare capacity for future modifications.

Communication area

RFI-shielded EMC solutions from Roxtec provide EMI protection for sensitive equipment as well as protection against fire, gas, smoke, water and vibration.

Motors, converters and switchgear

Ensure continuous operation with Roxtec EMC solutions for frequency converters, remote I/O and other disturbing or sensitive equipment, and combine IP ratings with protection against electromagnetic threats.

Outdoor deck area

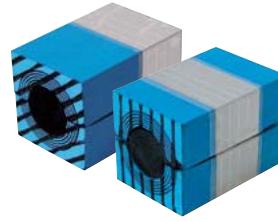

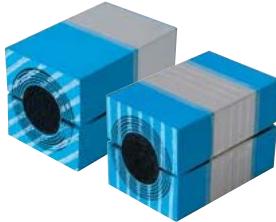

Roxtec EMC solutions can be used in corrosive environments to ensure both environmental and EMI protection – a safe way to secure antennas and functionality in case of lightning strikes.

Bulkhead, deck and floor penetrations

Roxtec provides frames with rounded corners to reduce stress in bulkheads. This transit combines electromagnetic shielding with certified protection against fire, smoke and water.

Roxtec modules for EMC

Roxtec full length modules are available for both single- and double-sided environmental protection while the shorter modules are available for single-sided environmental protection.

Roxtec BG B™/BG™

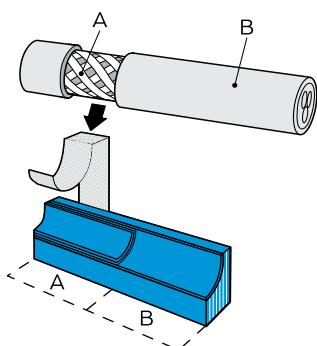

The BG B/BG product family is designed for bonding and grounding of armored and shielded cables. By design it also protects against conducted interference. The tin-plated copper braid shapes perfectly to the irregularities of the metallic armor and provides substantial copper mass to withstand high fault currents or surges from for example lightning strikes.

Roxtec ES B/ES

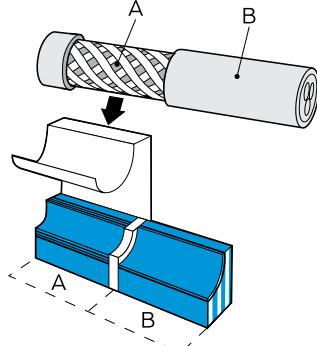

The ES B/ES product family is designed for shielded or screened cables where electromagnetic shielding is required in the cable entry. The low-impedance path from cable screen to earth eliminates conducted interference and provides at the same time a conductive barrier that efficiently prevents electromagnetic fields from penetrating the seal. The ES B/ES is intended for use with high quality shielded cables for entries into shielded environments such as enclosures or compartments of the ship.

Roxtec PE B/PE

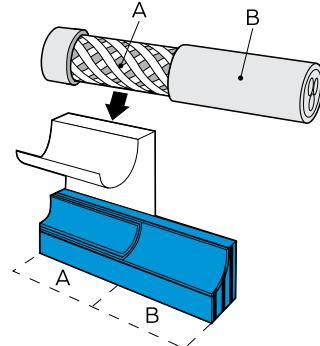

The PE B/PE products protect against conducted interference and are primarily intended for cables with braided and foil screens where current withstand capabilities and electromagnetic shielding are of less importance.

Section of a BG B module

Section of an ES B module

Section of a PE B module

Using the right cable and system

Cable constructions and types vary across the world, and the cables are designed with various specific purposes in mind. The fact that all Roxtec EMC products contact the first metallic layer, armor, screen or shield under the insulation influences the selection and installation of the correct products and frames.

Cable armor can be very rigid and made of corrugated aluminum or steel wires as its primary purpose is to provide mechanical protection. Other armor can be made of braided copper wires for

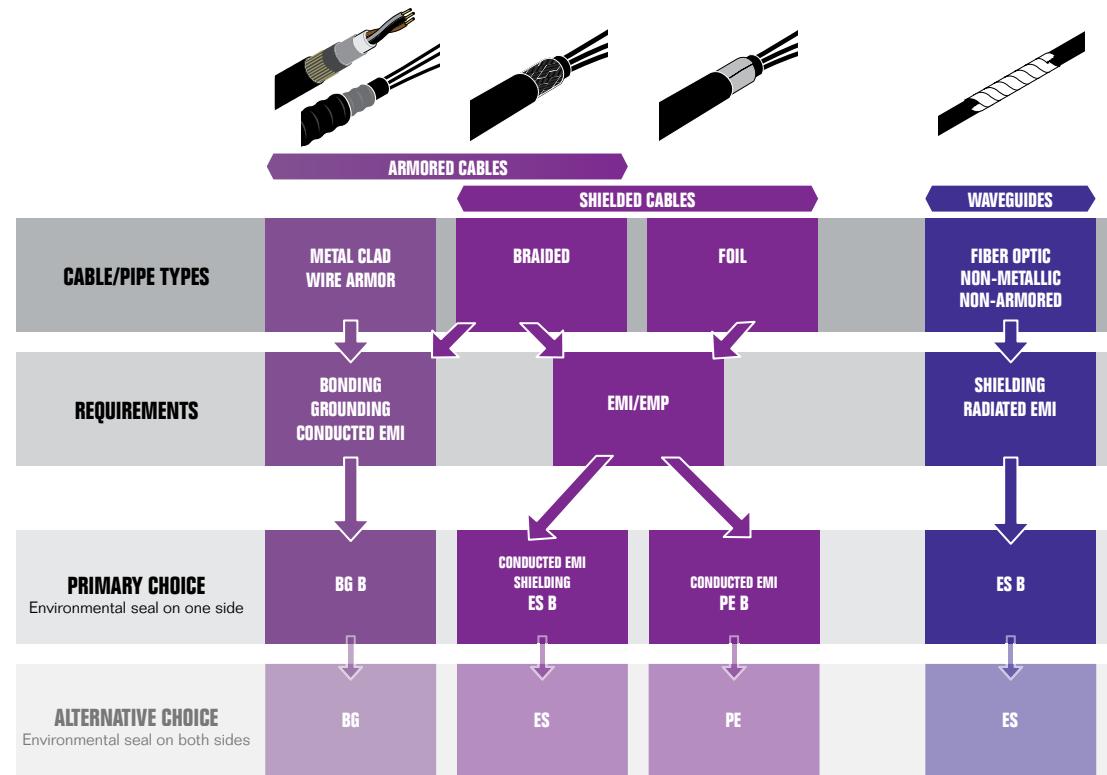

applications where flexibility is key. The tighter the braiding, the better electromagnetic shielding is achieved.

There are also cables with very thin screens of metallic foils for pure electromagnetic shielding and cable armor of copper wires with the function of being the return path for fault current, the protective earthing conductor. Therefore, it is important that the right cables are chosen for their intended purpose and installed in line with the intent.

The selection of what EMC seal-

ing system to use can be based on the expected cable or pipe type. If the application uses an armored cable, electrical safety must be considered meaning that a BG B/BG system is recommended. If the cables are shielded it is more likely an EMI application where the ES B/ES or PE B/PE system should be used. With the ES B/ES system, waveguide techniques can be applied when non-metallic fiber optic cables and plastic pipes or hoses run through an ES B/ES system into shielded environments.

EMC sealing system selection guide

Smart tip: Consider using an RM module rather than a solid module. A Roxtec RM module installed with a solid centre core serves the same purpose as a traditional solid module, but it also provides spare capacity for future installations.

1. Comes without ground lug
2. Conductive gasket not included
3. If installed by welding

Ground lug

Recommended addition to frames used for bonding and grounding. Frames with a ground lug with alternative flange dimensions available upon request.

Roxtec EMC marking tool

The marking tool is used for simple and quick guidance on where to remove the cable sheath and where to add check marks on the cables before assembly. This is to make sure that both the cable and its uncovered cable screen are fitted correctly into the module.

Roxtec ComSeal™ EMC

The Roxtec ComSeal EMC protects against EMI. The product family is designed for industrial and telecom applications such as converters, generators and cabinets. The frame is in nickel-plated aluminum and allows for pre-terminated cables.

- The frames are supplied as pre-defined kits
- Electromagnetic shielding

Roxtec CF 8/CF 32 EMC/BG frames/kits

The frames of cast aluminum with nickel-plating ensure good electrical conductivity. They can handle multiple pre-terminated cables/pipes in one opening.

- For use with CM BG B, CM ES or CM PE modules
- Electromagnetic shielding
- Potential equalization
- Bonding and grounding

Basic steps

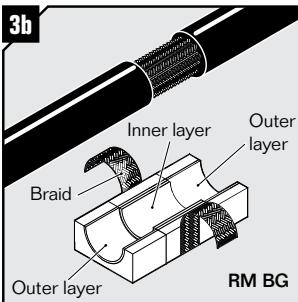

Clean the frame from dirt, paint etc. to secure good electrical conductivity.

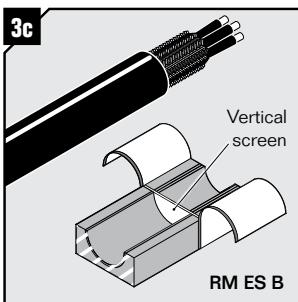

Cut and remove the outer sheath to expose the shield or armor of the cable.

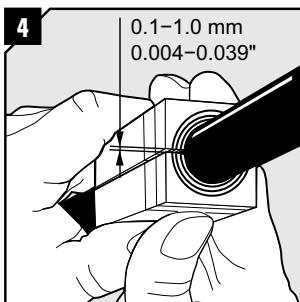

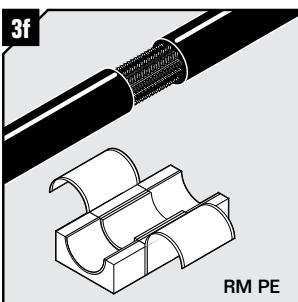

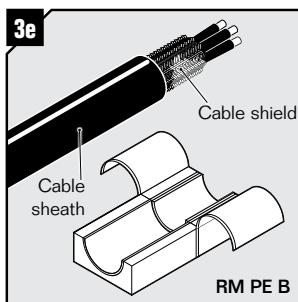

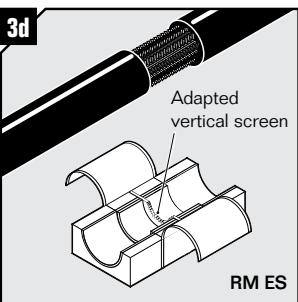

The following steps 3a–3f show the module preparation for the different types of EMC modules.

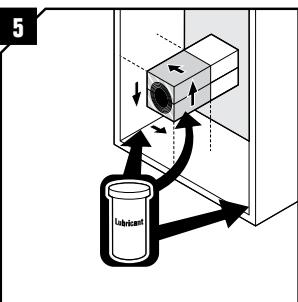

Fold back the tape or braid. Adapt the outer module layers to cable sheath and the inner ones to the cable shield.

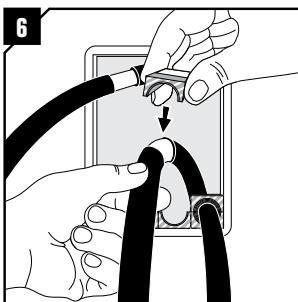

For ES modules, adapt vertical screen to cable shield.

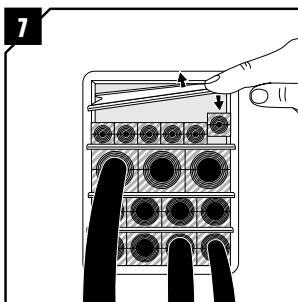

Achieve a 0.1–1.0 mm gap between the two halves when held against the cable/pipe. Fold the tape or braid tightly inside each module half.

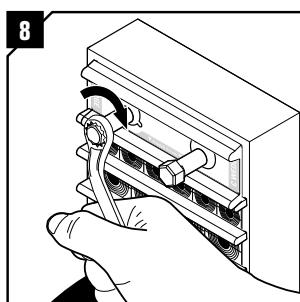

Lubricate the frame and modules.

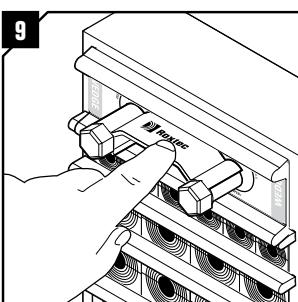

Place the cables in the module halves according to your packing plan.

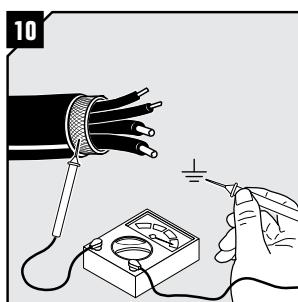

Insert a stayplate after every row of modules and fill the packing space.

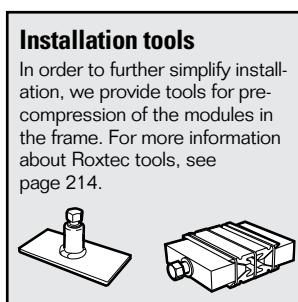

Lubricate and insert the wedge. Tighten the bolts alternately until full mechanical stop.

Attach the Wedge Clip to finalize the installation.

Verify earth continuity from each cable armor/screen to earth. Use a suitable instrument.

Installation tools

In order to further simplify installation, we provide tools for pre-compression of the modules in the frame. For more information about Roxtec tools, see page 214.

PIPE ENTRY SOLUTIONS

Covering a wide range of systems

Roxtec seals for pipe applications protect both life and assets against fire, water ingress and gas. They are designed to maintain the deck and bulkhead fire classifications after being penetrated by pipes.

A marine vessel is supported by a complex web of pipework which feeds various essential systems such as engine transfer systems, hydraulic fluid systems, sprinkler systems, hot and cold water and wastewater systems. The number of essential systems is matched by the variation in different types of pipe materials used to support them such as steel, copper, plastic and glass fiber.

Maintain the integrity

These variations in pipe material present multiple challenges when developing sealing solutions to protect pipe penetrations against hazards such as fire, water ingress and gas. To overcome

these difficulties, We have developed a wide range of pipe sealing solutions that offer protection against these hazards and maintain the integrity of the marine rated division.

Single or multiple pipes

Roxtec is also able to provide solutions that can be installed from only one side of the deck or bulkhead to increase flexibility within the installation process.

With a portfolio of certified pipe sealing solutions ranging from single to multiple penetrations and from 3.6 mm to 580 mm in diameter, we have the ability to meet all your pipe sealing needs.

Tested and certified

The sealing solutions offered by Roxtec provide protection to the following standards and ratings as defined by IMO and comply with the various testing programmes of each class society:

Fire rating: A class, B class, H class and jet-fire ratings

Water pressure: up to 6 bar

Gas-pressure: up to 2.5 bar

(All protection ratings depending on specific class society)

In addition to the standard Roxtec solutions, customized solutions can be designed and supplied which offer protection in areas that have higher demand requirements.

Safety and simplicity

The Roxtec pipe sealing solutions are designed to satisfy the various needs and requirements of

the marine segment. It is recognized that the demands in relation to fire integrity and water pressure requirements are different depending upon the location of the installation within the marine vessel.

Therefore, the Roxtec approach to its product range is to develop solutions that fit the relevant requirements for each of these areas in order to provide a safe and secure penetration seal that is both quick and easy to install. For this reason, the Roxtec product range includes firestop solutions, watertight and firestop solutions as well as solutions suitable for use either above or below the waterline.

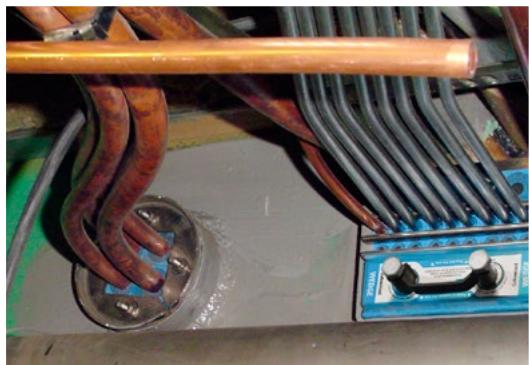

Developed for specific needs

In addition to these operating criteria, We have developed our solution to maintain a watertight seal after a fire has occurred. It is to be used when the requirements make this necessary due

to the use of heat sensitive materials passing through watertight bulkheads. To reduce the need for welding during the installation process, Roxtec has also developed pipe sealing products that are non-welding solutions. Roxtec pipe sealing solutions can be used in steel decks and bulkheads as well as in aluminum structures where galvanic corrosion and other installation issues have been resolved. Further Roxtec solutions are also available for use in some A and B rated sandwich panel structures.

Metal pipe solutions

Roxtec provides first class sealing solutions for single and multiple metal pipes when passing through in decks and bulkheads. Ship owners and shipbuilders appreciate the excellent fire-stopping and watertight features of our systems to ensure high degrees of security and to maintain a safe working environment.

Roxtec transits for metal pipes are available in a wide range of types and sizes for various environments and use. We supply modular-based transits for both multiple pipe penetrations and single pipe penetrations. There are frames for round and rectangular openings as well as frames specifically designed to maintain the structural integrity of certain openings when located in high demand areas.

- Water pipes
- Wastewater pipes
- Hydraulic pipes
- Pneumatic pipes
- Transfer and distribution systems
- Sprinkler systems
- Restaurant and beverage pipes

Roxtec RS seal

The Roxtec RS seal is a circular solution which protects single metal pipe as well as glass fiber pipe penetrations. It consists of two halves and an adaptable center with Multidiameter™ (removable layers for adaptability to pipes of different sizes).

- Tightness obtained by expansion within the seal
- Single pipe penetration
- Sleeves are available
- Single side installation
- Certified fire, water and gas protection

RS seal, with core, acid-proof stainless steel fittings

See sleeves on page 142.

Roxtec RS OMD seal

The Roxtec RS OMD seal is a circular solution which protects single metal pipe penetrations. It can be adjusted on the outside to fit non-standard sleeve sizes, and its two halves and adaptable center are also equipped with Roxtec Multidiameter™ (removable layers for adaptability to pipes of different sizes).

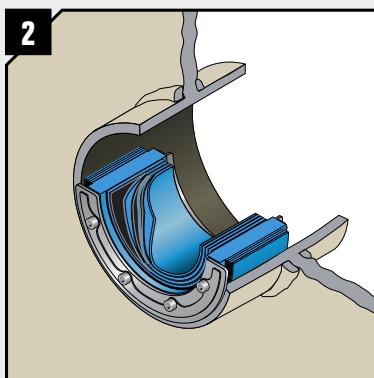

- Tightness obtained by expansion within the seal
- Multiple pipe dimensions covered by one product size
- Single side installation
- Certified for fire, water and gas protection
- Adaptability on the outside to fit round openings of varying sizes
- Single pipe penetration

How it works

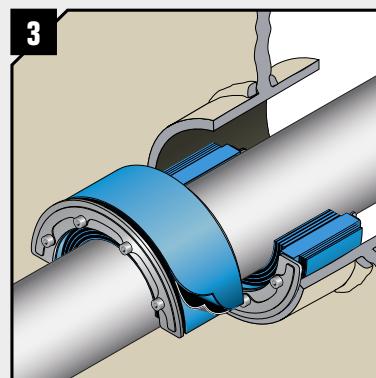

The example shows the features that make it quick and easy to install the RS OMD.

The Roxtec RS OMD has two halves equipped with removable layers on the outside. It can easily be adapted to fit openings of varying sizes and non-standard sleeve sizes.

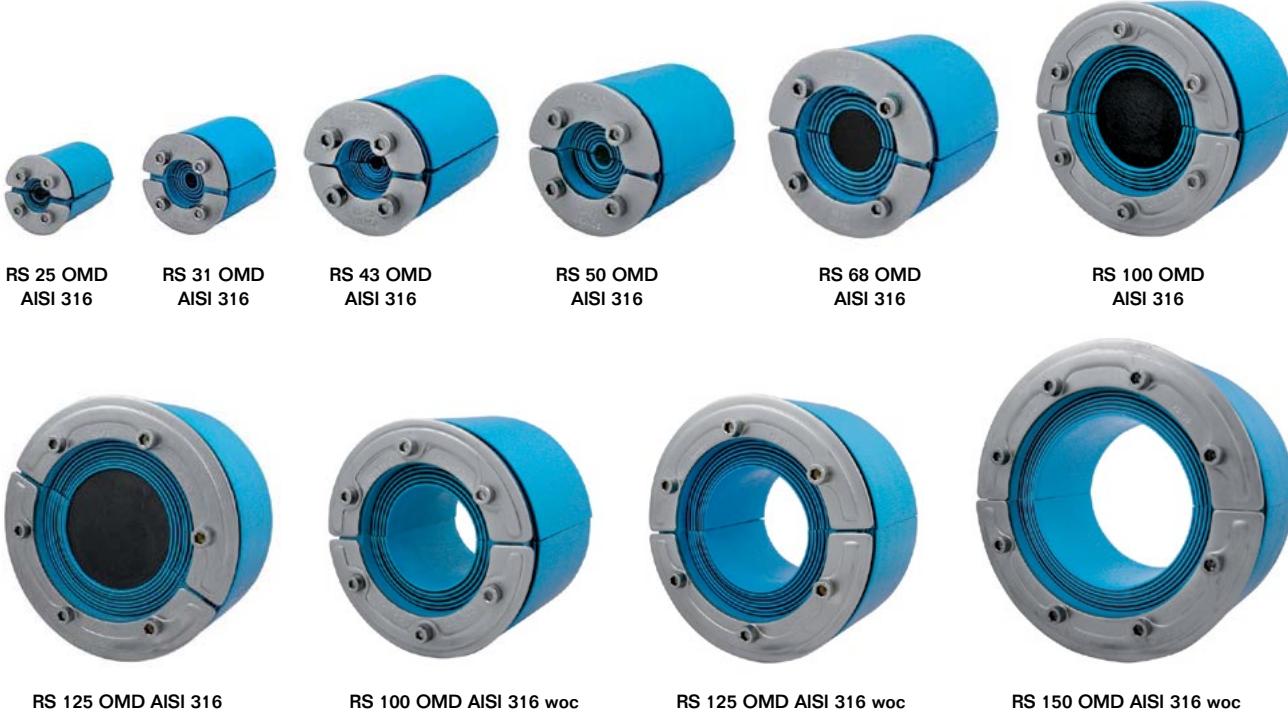

Each half of the seal is also equipped with removable layers inside in order to be adaptable to pipes of different sizes.

Each half is adapted on the inside and on the outside and the flexible solution is sealed by tightening the expansion mechanism.

RS OMD seal, acid-proof stainless steel fittings

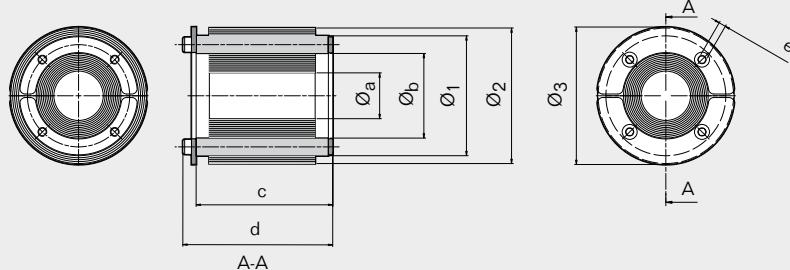

Installation instructions are available on www.roxtec.com

Roxtec R frame

The Roxtec R frame is a circular frame with a square packing space to encase RM modules with Multidiameter™. The solution protects multiple metal pipes penetrating an opening and also allows for "future included" planning by including extra capacity for metal pipe additions. The frame is simply inserted into the sleeve and compressed by expansion to seal the transit.

- Tightness obtained by expansion within the seal
- Multiple pipe dimensions covered by one product size
- Multiple pipe penetrations included within one opening in the deck or bulkhead
- Single side installation
- Certified fire, water and gas protection
- Sleeves are available

Roxtec SPM™ seal

The Roxtec SPM is a non-weld solution for any kind of metal pipe. It maintains a tight seal around the pipe as well as inside an uneven opening. The seal is quick and easy to install from only one side of steel decks or bulkheads which may range in thickness from 6 to 15 mm.

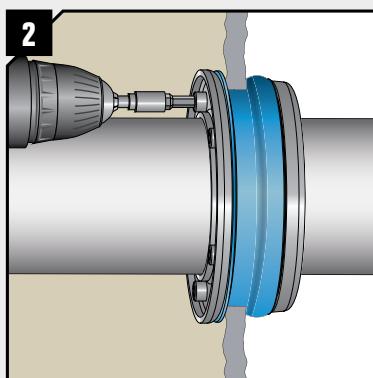

- Light-weight
- Single pipe penetration
- Single-side installation
- Non-weld solution
- Certified fire, water and gas protection

How it works

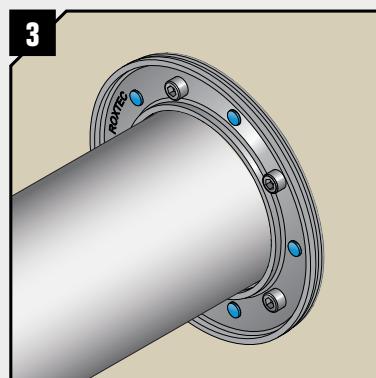

The example shows the features that make it a quick and easy process to install the Roxtec SPM seal.

Slide the pipe through the Roxtec SPM seal and insert it into the opening. The seal copes with wide tolerances towards both pipe and opening.

Fit the seal against the inside of the opening and tighten the bolts. It maintains a tight seal around the pipe and inside the opening.

The indicators show when full compression is achieved in order to simplify both installation and inspection.

SPM™ seal, acid-proof stainless steel fittings

Roxtec R X, RS X seals

The Roxtec R X and RS X seals are designed for retrofit or installations late in the process when welding is not allowed. The kit consists of a non-welding sleeve (SLX) and an RS seal for a single pipe penetration or an R frame for multiple pipes. The R X solution also provides built-in spare capacity for future upgrades.

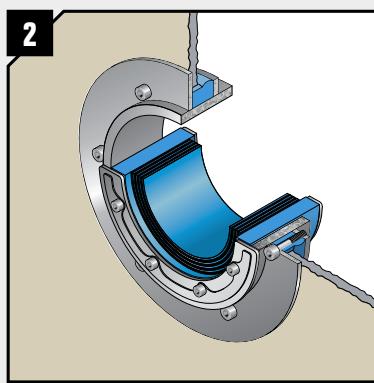

- R X for use with RM modules
- Single or multiple metal pipe penetrations
- Multiple pipe dimensions covered by one product size
- Single side installation
- Certified fire, water and gas protection

How it works

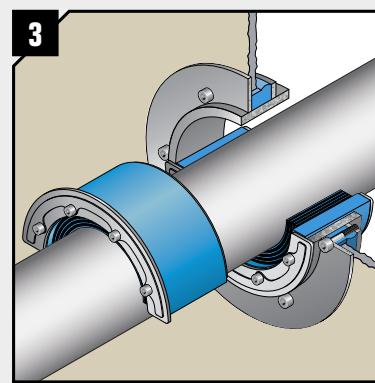

The example shows the features that allow the RS X to be installed in a deck or bulkhead without welding.

The Roxtec RS X is attached through expansion. Its rubber compresses and expands towards the inside of the opening to create tightness between the structure and the SLX sleeve (included in the kit).

The standard operation of the seal also compresses the rubber against the outside of the pipe.

Each half of the seal is equipped with removable layers in order to be adaptable to any pipe.

R X kits, galvanized with galvanized sleeve

Roxtec S frame

The Roxtec S frame is a metal frame attached by welding. It comes as a single opening or in various combination options and provides packing space for numerous sizes of Roxtec RM modules with Multidiameter™. The solution protects multiple metal pipe penetrations and also allows for "future included" planning by including extra capacity for future metal pipe additions.

- For use with Group RM components
- Attachment by welding
- Multiple pipe dimensions covered by one product size
- Multiple pipe penetrations included within one opening in the deck or bulkhead
- Single side installation
- Certified fire, water and gas protection

S frame, primed mild steel

S 6x1 primed

See parts needed for a complete solution on page 26.

See installation instructions on page 222.

See practical user guidelines on page 264.

Remove primer from the inside of the frame to ensure good conductivity in EMC applications.

For information about other frame combinations, or for openable versions of this frame, please contact your local Roxtec supplier or e-mail: info@roxtec.com

Plastic pipe solutions

An increasing trend within the marine industry to use plastic pipe has led us to develop a significant portfolio of products to protect and seal plastic pipe penetrations.

The Roxtec plastic pipe seals are available in a wide range of types and sizes. Seals can be fitted for circular or rectangular openings for either single or multiple plastic pipe penetrations.

Reducing the risk

Plastic pipe penetration seals require an additional level of protection. In the event of a fire onboard a marine vessel, the plastic pipe will quickly soften, melt and disappear, thus leaving a hole in the deck or bulkhead through which the fire can escape and spread into the next compartment. Therefore, the Roxtec pipe sealing solutions need to react during the fire in order to plug or block the hole created by the disappearing plastic pipe to reduce the risk of a fire spreading.

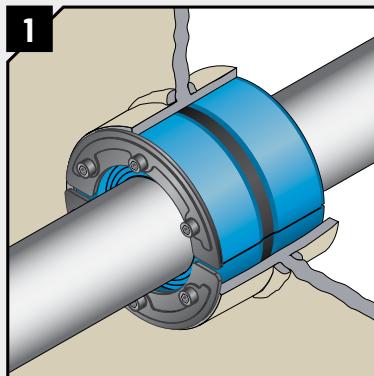

The Roxtec Sleev-it™ solutions and the Roxtec R and RS PPS series contain a mix of intumescent based material. When exposed to the high temperatures of a fire, it reacts by expanding many times its volume. This creates a pressure inside and crushes the softening plastic pipe to form a plug of material which blocks the opening to stop the fire and smoke from spreading into the next compartment. In areas where higher watertight demands are required, we recommend pipe sealing options that incorporate Multidiameter™. In areas where watertight requirements do not exist or are lower,

such as within some installations above the waterline, we recommend the Roxtec Sleev-it™ range. When the watertight integrity has to be maintained even after the fire, we can also offer a back-to-back solution (see page 188). Roxtec solutions for plastic pipes facilitate the decisions of ship owners and shipbuilders to use plastic pipe which may lead to lighter vessels, lower fuel costs, less corrosion issues and reduced maintenance costs. Roxtec seals do not only ensure safety, they also contribute to holding down the total cost of ownership.

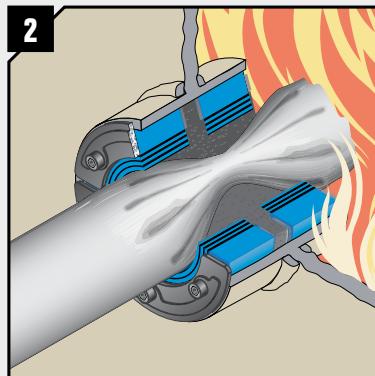

- Flexible solutions
- Solution choices to fit applicable requirements
- Single or multiple plastic pipe penetrations
- Certified protection for various types of plastic pipe
- Single-side installation
- Certified fire, water and gas protection

How it works

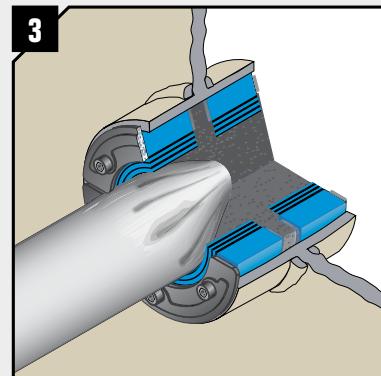

The example shows the RS PPS/S in action. The functionality of the other Roxtec plastic pipe solutions is fundamentally the same.

The Roxtec RS PPS/S seals the plastic pipe against leakage of water and gas through the steel division. Inside the seal, there is an intumescent based material.

This material will expand and close the middle void of the pipe whenever exposed to high temperatures, such as during a fire.

Should a fire occur and the plastic pipe start to burn and melt, the opening will close completely to prevent fire and smoke from spreading through the bulkhead or deck.

Roxtec RS PPS/S, single-side seal

The Roxtec RS PPS/S seal is a circular solution which protects single plastic pipe penetrations. It consists of two halves and an adaptable center with Multidiameter™ (removable layers for adaptability to pipes of different sizes). The two halves are simply inserted into a sleeve and the compression unit inside the seal is tightened in order to correctly protect the plastic pipe. Inside each half, a layer of intumescent based material is placed which reacts with the heat of a fire to protect the penetration once the plastic pipe begins to soften. This solution is installed from only one side of the deck or bulkhead.

- Approved for single-side installation
- Certified protection for various types of plastic pipe
- Single plastic pipe penetrations
- Multiple pipe dimensions covered by one product size
- Certified fire, water and gas protection

RS PPS/S seal, acid-proof stainless steel fittings

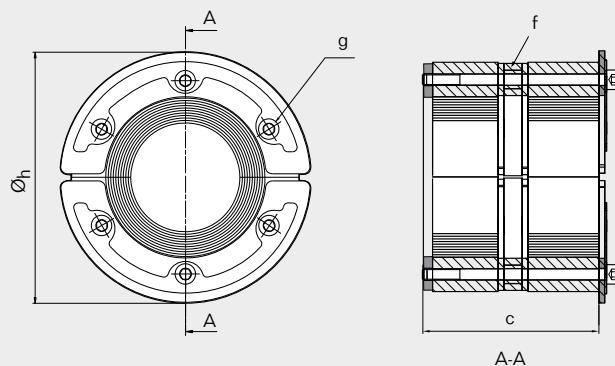

See sleeves on page 174.
See installation instructions on page 239.

Roxtec RS PPS back-to-back seal

The Roxtec RS PPS seal is a circular solution which protects single plastic pipe penetrations. The solution comes as a kit and consists of two RS seals and one intumescent based sealing strip that wraps around the plastic pipe, in between the two RS seals. Each RS seal has two halves and an adaptable center with Multidiameter™ (removable layers for adaptability to pipes of different sizes). The two halves are simply inserted into each side of the sleeve and the compression units inside the seals are tightened to correctly protect the plastic pipe. Unlike most Roxtec sealing solutions, the RS PPS seal has to be installed on both sides of the division.

- Intended for use with SL PPS sleeves
- Certified protection for various types of plastic pipe
- Multiple pipe dimensions covered by one product size
- Single plastic pipe penetrations
- Certified fire, water and gas protection

Roxtec SE PPS extension frame

The Roxtec SE PPS extension frame is an accessory which in conjunction with a standard Roxtec S/SF frame protects installations of several plastic pipe penetrations against the risk of fire. The solution includes a layer of intumescent based material which reacts with the heat of a fire to protect the penetration once the plastic pipe begins to soften.

- Single-side installation
- Certified protection for various types of plastic pipe
- Multiple pipe penetrations included within one opening in the deck or bulkhead
- Certified fire, water and gas protection
- Options to allow a mix of pipe materials (metal and plastic) and in some cases, even cables within the same opening

SE PPS extension frame, galvanized

SE PPS 6x1 galv

See parts needed for a complete solution on page 26.

See practical user guidelines on page 264.

Installation instructions are available on www.roxtect.com

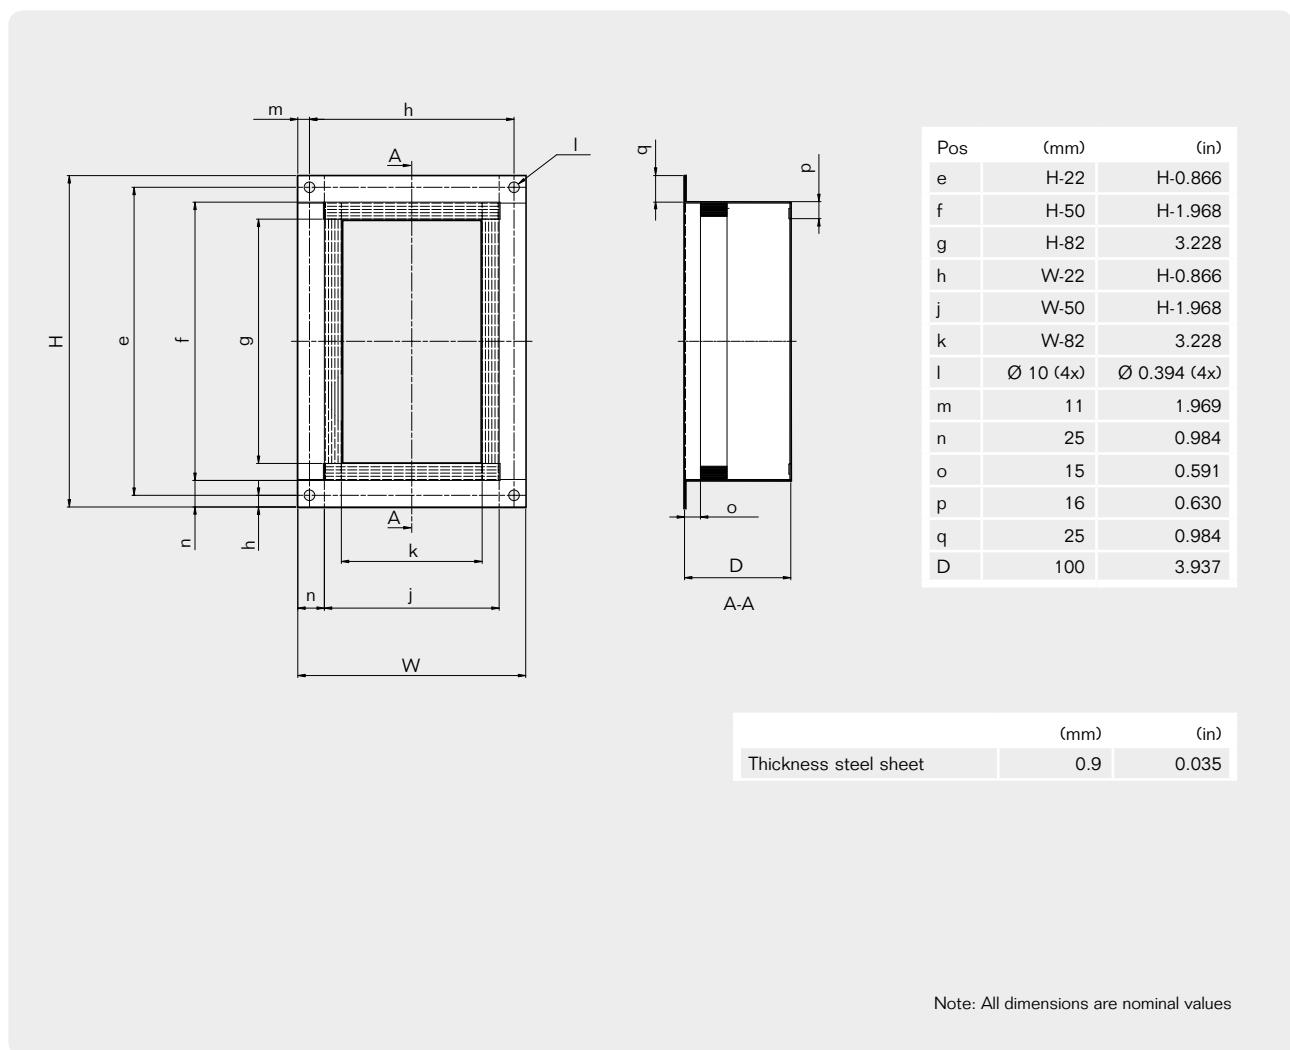

For information about other frame combinations, please contact your local Roxtec supplier or e-mail: info@roxtect.com

Roxtec Sleev-it™ Fire penetration seal

The Roxtec Sleev-it Fire penetration seal is a circular solution which protects single plastic pipe penetrations against fire hazards. The solution requires no sleeve to be installed and its stainless steel casing contains layers of intumescent based material that react with the heat of a fire to protect the penetration once the plastic pipe begins to soften. The light weight and ease of installation benefits of this product make it an ideal solution when used in fire only rated divisions.

- Single-side installation
- Minimal hot work onboard as it only requires tack welding into place
- Certified protection for various types of plastic pipe
- Quick and easy to install
- The openable aspect benefits retrofit as well as new-build projects

Roxtec Sleev-it™ Fire penetration seal, mild steel/stainless steel

Roxtec Sleev-it™ Waterproof penetration seal

The Roxtec Sleev-it Waterproof penetration seal is a circular solution which protects single plastic pipe penetrations against the risks of fire and water. Its stainless steel casing contains layers of intumescent based material that react with the heat of a fire to protect the penetration once the plastic pipe begins to soften. The specifically engineered rubber grommet is sized per specific pipe size in both metric and imperial sizes and designed to maintain a waterproof seal round the plastic pipe.

- Single-side installation benefits
- Certified protection for various types of plastic pipe
- Quick and easy to install
- Certified to 1 bar of water pressure
- Not to be used in high pressure watertight divisions

Roxtec Sleev-it™ Transition collar

The Roxtec Sleev-it Transition collar is a stainless steel casing that wraps around the joint between a steel and plastic pipe. The casing contains layers of intumescent based material that react with the heat of a fire to protect the transition once the plastic pipe begins to soften. The solution is not a coupling between the steel and plastic pipe.

- For steel and plastic pipe connections – not a coupling mechanism
- For use in non-pressurized systems
- Certified protection for various types of plastic pipe
- Quick and easy to install – a non-welding solution

Roxtec Sleev-it™ Transition collar, stainless steel

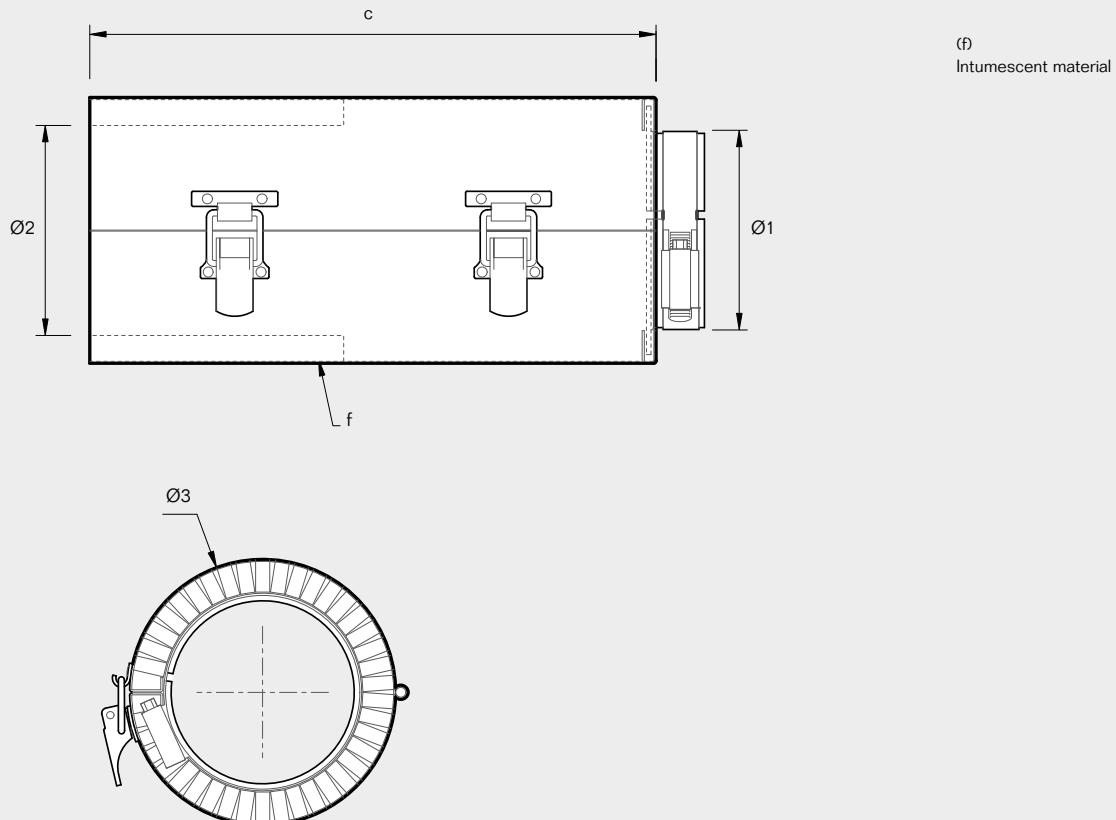

Sleev-it TR-MAR

See installation instructions
on page 251.

Water-tightness after fire solutions

We are continuously working to find sealing solutions for our customers. One example is our “back-to-back” arrangements that maintain watertight integrity after a fire.

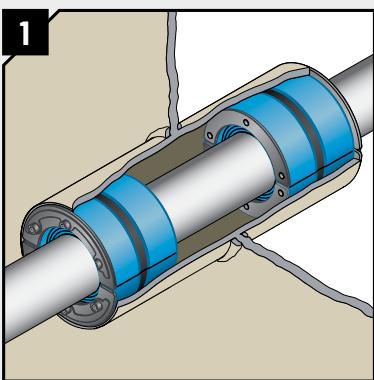

Wording within the applicable SOLAS regulations refers to heat sensitive material penetrating bulkhead structures below the waterline, where deterioration of such materials in the case of fire may impair the watertight integ-

rity of the bulkhead. The wording specifically applies to watertight installations in SPS vessels and passenger ships for penetrations below the waterline. In order to comply with this regulation, Roxtec has conducted a series

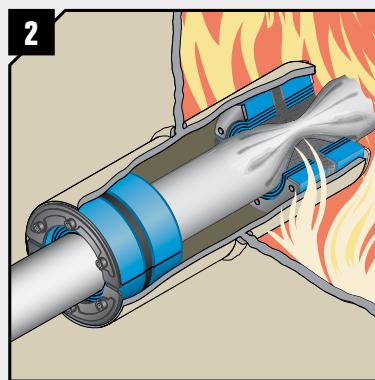

of tests with “back-to-back” arrangements within an elongated sleeve. These tests have successfully maintained watertight integrity after a fire exposure has occurred.

How it works

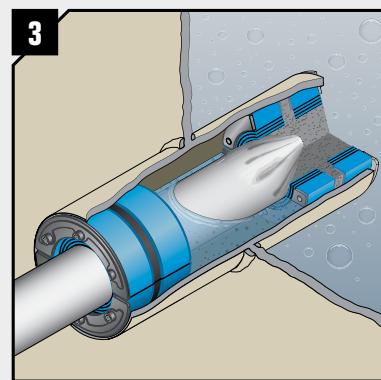

The example shows the Roxtec RS PPS/S F+WT seal in action.

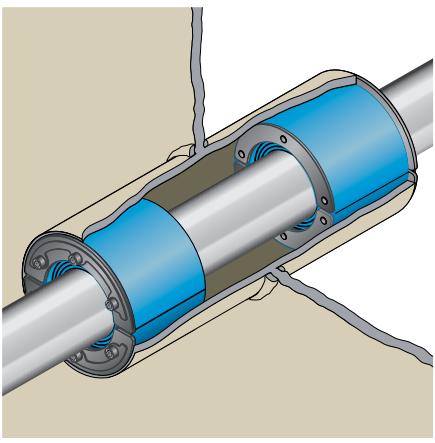

The Roxtec RS PPS/S F+WT sealing solution includes two RS PPS/S seals to provide a gas and watertight seal around the plastic pipe. Inside the seals we have a layer of intumescent based material designed to react during a fire.

Whenever exposed to the high temperatures of a fire, the material inside the RS PPS/S seal on the fire side of the penetration will exfoliate and expand to crush the softening plastic pipe in order to prevent the fire and smoke from spreading through to the next compartment.

Should a second catastrophic event such as a flood take place, the intumescent based material will not maintain a watertight seal however, the RS PPS/S seal that was not affected by the fire, will maintain its gastight and watertight qualities which will protect the penetration in the division against water ingress.

Roxtec RS F+WT

The Roxtec RS F+WT is a back-to-back sealing solution for openings with single metal pipe penetrations in bulkheads where there is a demand for water-tightness after fire. The kit consists of two RS seals providing protection against hazards caused by fire, gas and water. In case of fire, it efficiently blocks smoke and flames from passing through the penetration, and after a fire it still maintains watertight integrity.

- Double-sided installation inside an extended sleeve (length 312 mm)
- Certified protection for various types of metal pipes
- Single metal pipe penetrations
- Multiple pipe dimensions covered by one product size
- Certified fire, water and gas protection

RS F+WT kit, acid-proof stainless steel fittings

Roxtec RS PPS F+WT

The Roxtec RS PPS F+WT is a back-to-back sealing solution for openings with single plastic pipe penetrations in bulkheads where there is a demand for water-tightness after a fire. The kit solution is an extension of the RS PPS/S F+WT solution as it protects larger plastic pipe diameters by following a similar design. To achieve this, the solution requires a longer extended sleeve. The kit also consists of two standard RS seals and two intumescent based sealing strips which need to be wrapped around the plastic pipe and placed inside the sleeve before the RS seals are tightened. Once installed, the sealing solution will efficiently block smoke and flames from passing through the penetration, and after a fire it will still maintain watertight integrity.

- Double-sided installation inside an extended sleeve (length 700 mm)
- Certified protection for various types of plastic pipe
- Single plastic pipe penetrations
- Multiple pipe dimensions covered by one product size
- Certified fire, water and gas protection
